STABILITY & ESTHETICS**

INTRODUCTION

Dentures

Predictable success with function, stability & Esthetics

Digital Smile's **Acrylic Dentures** provide a practical solution for patients ineligible for implant-based alternatives. With advanced base materials and diverse denture teeth options, our dentures offer both aesthetic appeal and durability. Crafting full dentures for edentulous patients is often challenging, leading many dentists to hesitate in accepting denture cases due to unpredictable outcomes. At DigitalSmile, we prioritize three key principles in designing complete denture prosthetics: function, stability, and retention. Recognizing that esthetics is paramount for denture wearers, we strive to deliver a reliable and visually pleasing alternative.

Screw Retained Dentures, also known as fixed or All-on-4 dentures offer a permanent solution for full upper or lower dentures. Using four or more implants, these dentures are securely affixed with screws, providing stability.

Partials

Taking partials a step further

Acrylic Partial Dentures with metal frameworks are often chosen over other types of partials when precise fit and stability are a concern. Metal frameworks are also suited for cases when retention by semi-precision, or precision attachments are desired. Digital Smile offers a purely digital workflow that produces excellent fitting partials. This is great news for the patients.

With **Flexible and Clear Partial Dentures**, you can count on a lightweight framework, transparent, resistant to water absorption, and beautiful esthetic. Made with flexible material and a 100% metal-free design, this product allows for improved patient satisfaction, comfort, and easy chairside adjustments.

Guards & Devices

A guard to a wide range of treatment options

The **Hard Night Guard** ensures day or night protection with a precise fit, maximum rigidity, and durability for occlusal comfort.

The **Hard-Soft Night Guard** features a hard outer layer, soft liner overlay, and an added hard acrylic layer for a flat the the occlusal plane, providing even thickness and contouring to replicate the arch form.

The **Soft Night Guard** made of flexible EVA, is suitable for sensitivity, missing teeth, or athletic use, offering a standard 3mm thickness and adjustability.

The **Sports Guard** crafted from sturdy yet pliable materials, prioritizes athlete teeth safety, available in various styles from single to triple-layered for flexibility and toughness.
